April 18, 2022

Learning the usage of HTML, CSS, JS, Github, and other technologies in the Internet Applications course can be utilized in many innovative ways in the Library and Information services.

Having the basic knowledge of coding provides those of us in the library field a point of reference. Because the use of HTML, CSS, JS, Github and other technologies include many jargons and technical terms, we now have general knowledge on a new field of study, and thus, can better help library users who are within that field to find the information and resources that they are looking for.

With a first-hand experience in attempting to code, this also helps us to design new library programs around coding in a way that makes it more accessible and easier to learn for those who may wish to try coding for the first time. We now have a list of resources that we can provide for library users who are beginner coders, such as w3school, HTML validators, etc., that will help library users to code.
